

There is two kind of week tide :

- Neap tide week, the sea don't go so far, we have access only to the holding area
- Spring tide week, the sea go farer and we have access to the growing area

Winter season :

- Grading oysters on a grading machine which consist to :
- Fill up of oysters the big feeder
- Sorting oysters on rolling carpets to take off the dead one, the one with a bad shape and the one who are stock together to be split up by another person
- Bagging the sorted oyster and build a pallet with the oysters sacks. Those pallets will be load on the trailer to go on the beach

Summer season :

- Rebagging oysters (splitting up one bag in 2 or 3 bags for example)
 - Filling up of oysters the small feeder
 - Sorting oysters inside that feeder
 - Bagging the oysters and build a pallet with the new oysters sacks. Those pallets will be load on the trailer to go on the beach
- On the beach, oysters bags are turned to :
 - Change the position of the oysters inside the bag
 - Unstock oysters who are growing on/in the screen bag
 - Get rid of the sea weed on the top face of the sack, to up side down it in way for the sea weed to do less photosynthesis

All year long :

- The worked oysters are unload on the beach, in the oyster's bed, either in the holding area or the growing area, depending if that oysters are for sell or grow
- Oysters are harvesting from the growing area to the holding area (to be work the week after the spring tide) and to the packing house to be work straight away. For that the oysters bags are load on the trailer
